

## Natural

 $\mathbb{N}$ 

Natural numbers are the counting numbers  $\{1, 2, 3, \dots\}$  (positive integers) or the whole numbers  $\{0, 1, 2, 3, \dots\}$  (non-negative integers). Mathematicians use the term "natural" in both cases.

## Integer

 $\mathbb{Z}$ 

Integers are the natural numbers and their negatives  $\{\dots -3, -2, -1, 0, 1, 2, 3 \dots\}$ . ( $\mathbb{Z}$  is from German *Zahl*, "number".)

## Rational

 $\mathbb{Q}$ 

Rational numbers are the ratios of integers, also called fractions, such as  $\frac{1}{2} = 0.5$  or  $\frac{1}{3} = 0.333\dots$ . Rational decimal expansions end or repeat. ( $\mathbb{Q}$  is from quotient.)

## Real Algebraic

 $\mathbb{A}_R$ 

The real subset of the algebraic numbers: the real roots of polynomials. Real algebraic numbers may be rational or irrational.  $\sqrt{2} = 1.41421\dots$  is irrational. Irrational decimal expansions neither end nor repeat.

## Real

 $\mathbb{R}$ 

Real numbers are all the numbers on the continuous number line with no gaps. Every decimal expansion is a real number. Real numbers may be rational or irrational, and algebraic or non-algebraic (transcendental).  $\pi = 3.14159\dots$  and  $e = 2.71828\dots$  are transcendental. A transcendental number can be defined by an infinite series.

## Real Number Sets

## Complex Number Sets

### Imaginary

Imaginary numbers are numbers whose squares are negative. They are the square root of minus one,  $i = \sqrt{-1}$ , and all real number multiples of  $i$  such as  $2i$  and  $i\sqrt{2}$ .

### Algebraic

 $\mathbb{A}$ 

The roots of polynomials, such as  $ax^3 + bx^2 + cx + d = 0$ , with integer (or rational) coefficients. Algebraic numbers may be real, imaginary, or complex. For example, the roots of  $x^2 - 2 = 0$  are  $\pm\sqrt{2}$ , the roots of  $x^2 + 4 = 0$  are  $\pm 2i$ , and the roots of  $x^2 - 4x + 7 = 0$  are  $2 \pm i\sqrt{3}$ .

### Complex

 $\mathbb{C}$ 

Complex numbers, such as  $2 + 3i$ , have the form  $z = x + iy$ , where  $x$  and  $y$  are real numbers.  $x$  is called the real part and  $y$  the imaginary part. The set of complex numbers includes all the other sets of numbers. The real numbers are complex numbers with an imaginary part of zero.

## Properties of the Number Sets

### $\mathbb{N} \subset \mathbb{Z} \subset \mathbb{Q} \subset \mathbb{R} \subset \mathbb{C}$

Closed under Addition <sup>1</sup>		The complex numbers are the algebraic completion of the real numbers. This may explain why they appear so often in the laws of nature.
Closed under Multiplication <sup>1</sup>		
Closed under Subtraction <sup>1</sup>		
Closed under Division <sup>1</sup>		
Dense <sup>2</sup>		
Complete (Continuous) <sup>3</sup>		
Algebraically Closed <sup>4</sup>		

1. Closed under addition (multiplication, subtraction, division) means the sum (product, difference, quotient) of any two numbers in the set is also in the set.
2. Dense: Between any two numbers there is another number in the set.
3. Continuous with no gaps. Every sequence of numbers that keeps getting closer together (Cauchy sequence) will converge to a limit in the set.
4. Every polynomial with coefficients in the set has a root in the set.

# Numbers

Start with the counting numbers (zero may be included).

## Natural

 $\mathbb{N}$ 

Extend the line backward to include the negatives.

## Integer

 $\mathbb{Z}$ 

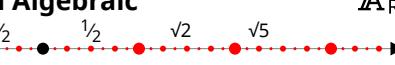

Insert all the fractions.

## Rational

 $\mathbb{Q}$ 

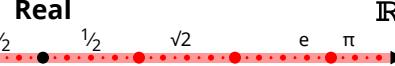

Insert all the roots.

## Real Algebraic

 $\mathbb{A}_R$ 

Fill in all the numbers to make a continuous line.

## Real

 $\mathbb{R}$ 

$\mathbb{N} \subset \mathbb{Z} \subset \mathbb{Q} \subset \mathbb{A}_R \subset \mathbb{R}$

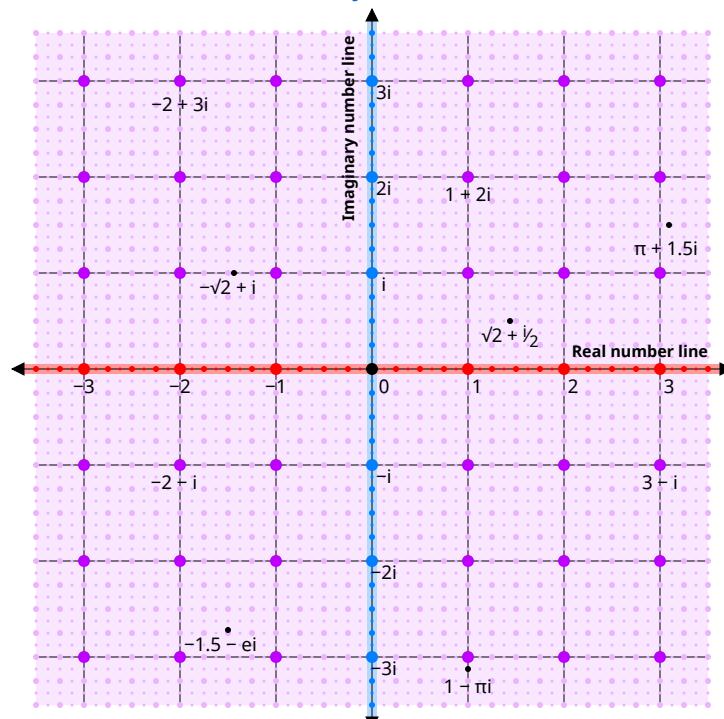

## Real Number Line

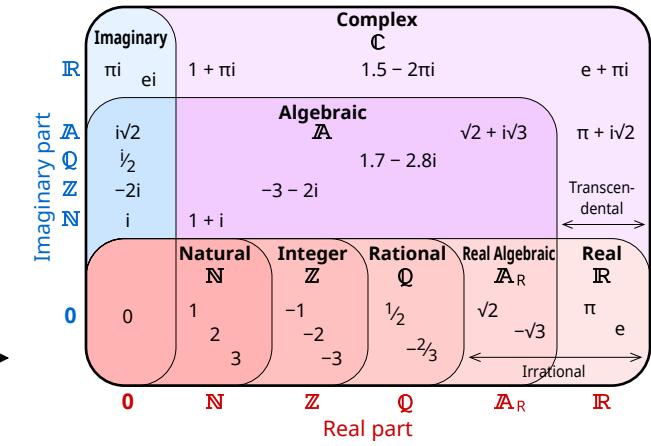

## Real Number Set Diagram

## Complex Number Plane

$$z = x + iy \quad i = \sqrt{-1}$$

## Complex Number Set Diagram

$\mathbb{N} \subset \mathbb{Z} \subset \mathbb{Q} \subset \mathbb{A}_R \subset \mathbb{R} \subset \mathbb{C}$

Note: This is an Euler diagram.

## Infinity $\infty$

The integers, rational numbers, and algebraic numbers are countably infinite, meaning there is a one-to-one correspondence with the counting numbers. The real numbers and complex numbers are uncountably infinite, as Cantor proved.
